1. INTRODUCTION

1. INTRODUCTION

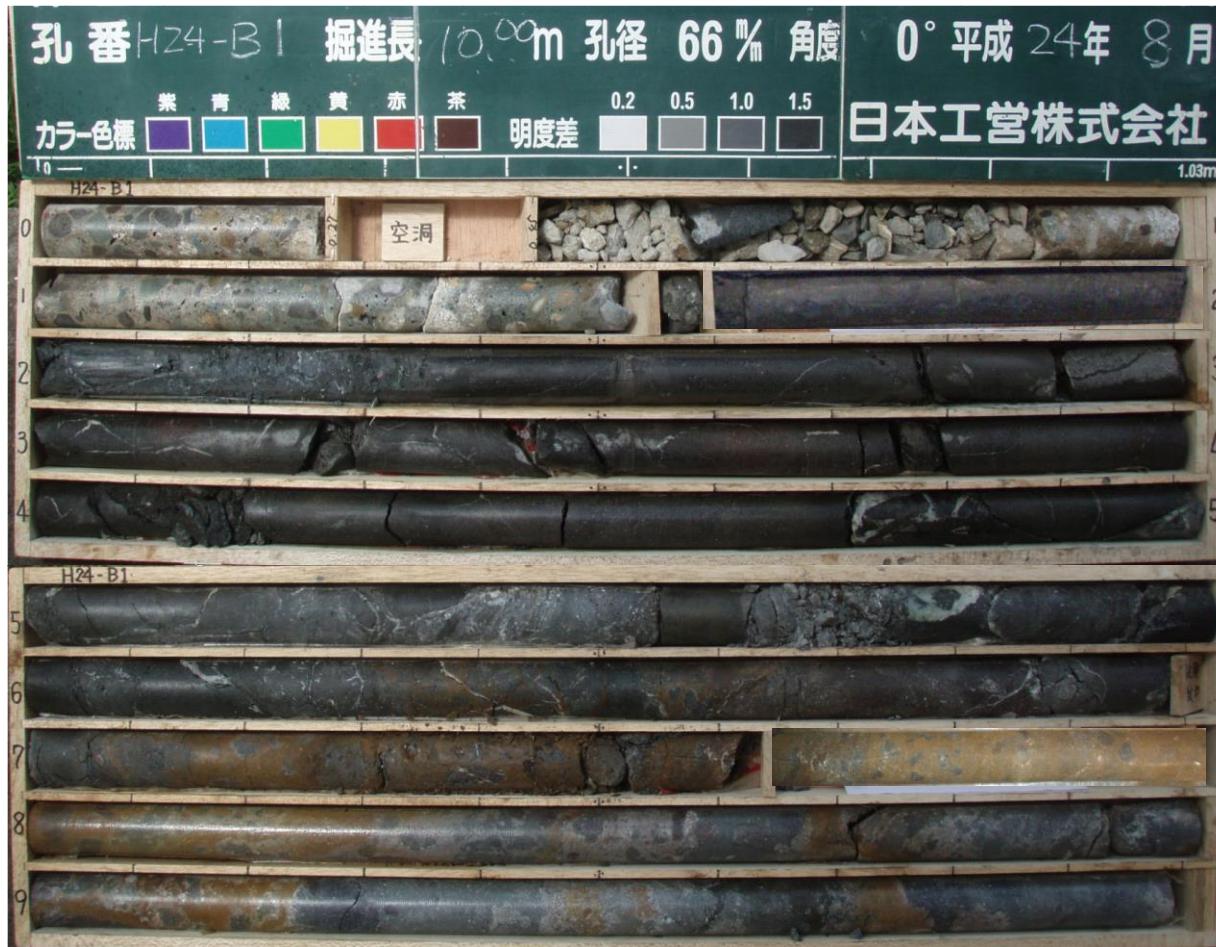

Invert concrete about 10 years after construction

cracks on the entire surface

1. INTRODUCTION

Just collected

A few days later

The box is broken by swelling

1. INTRODUCTION

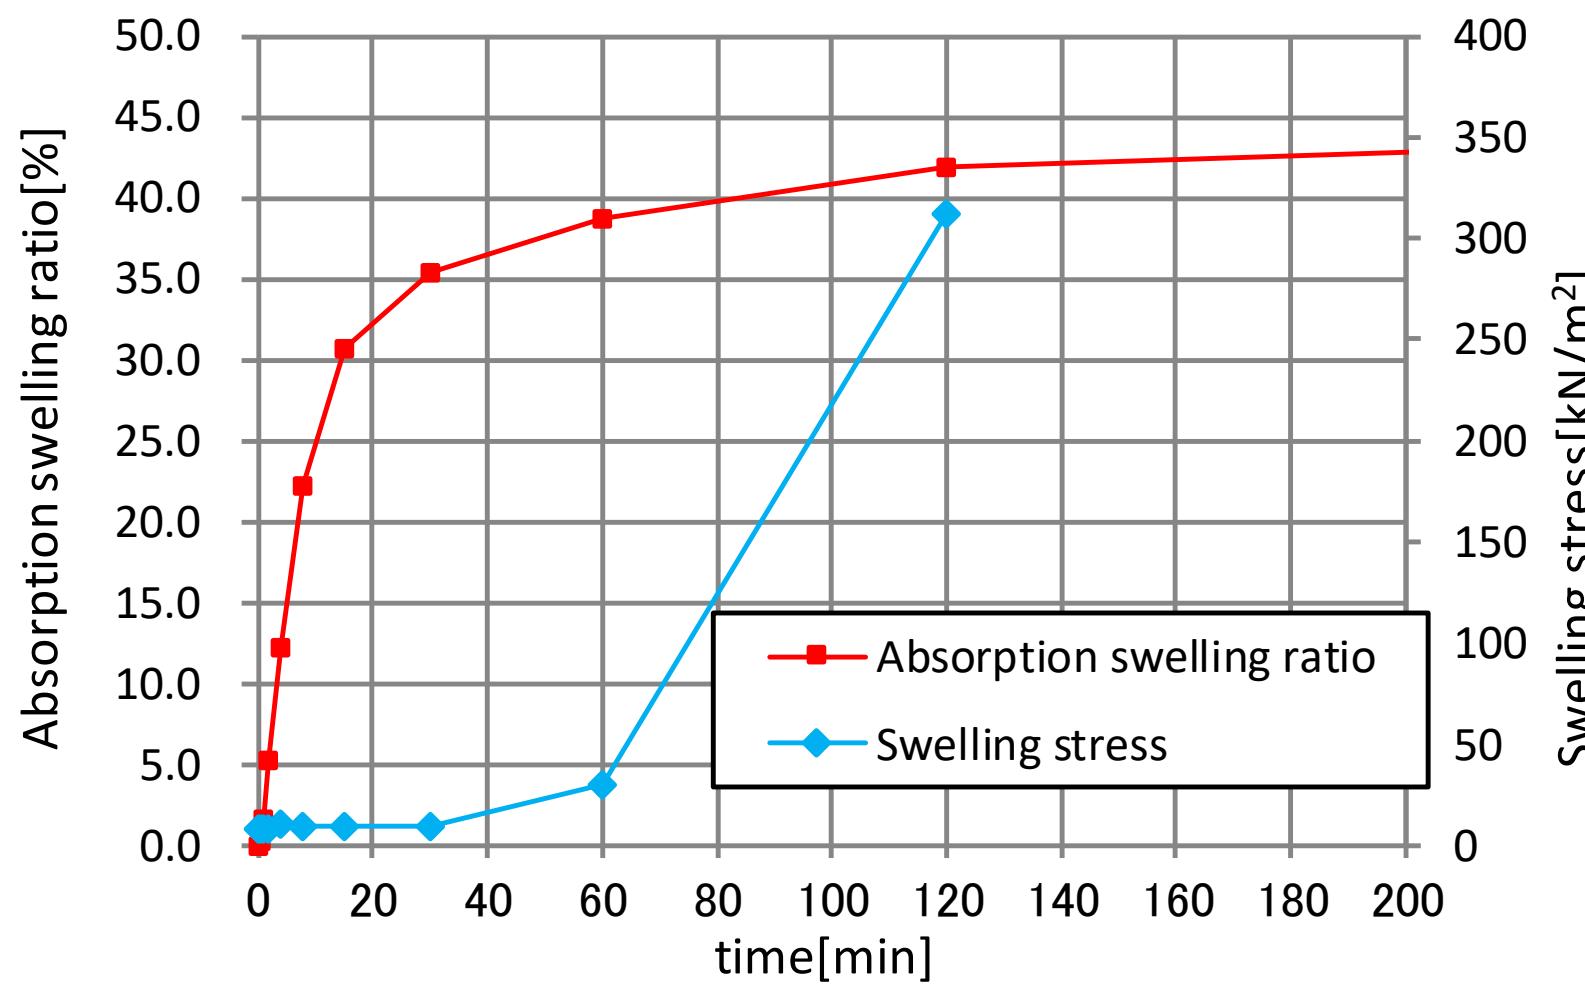

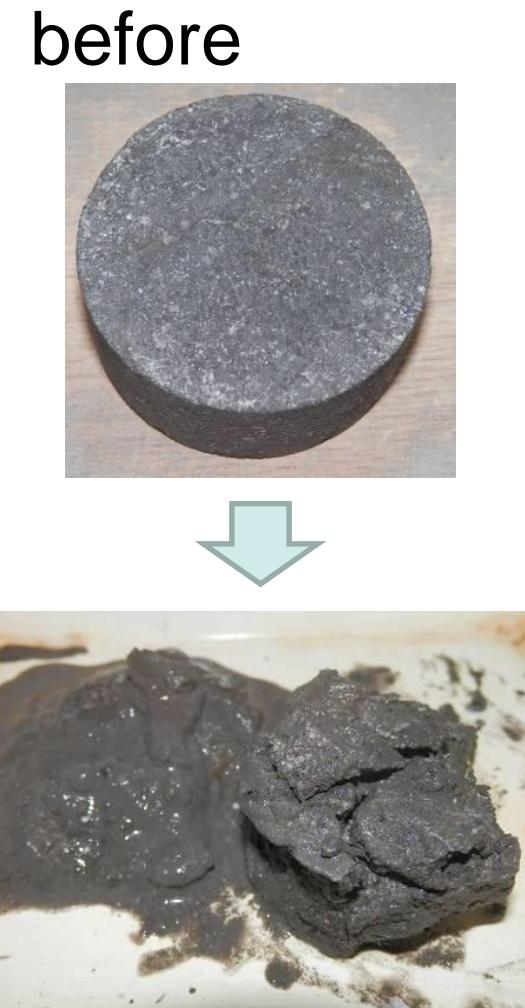

Figure 1. The results of swelling test

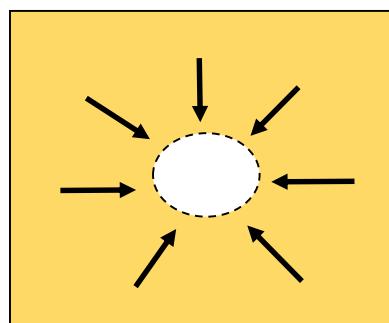

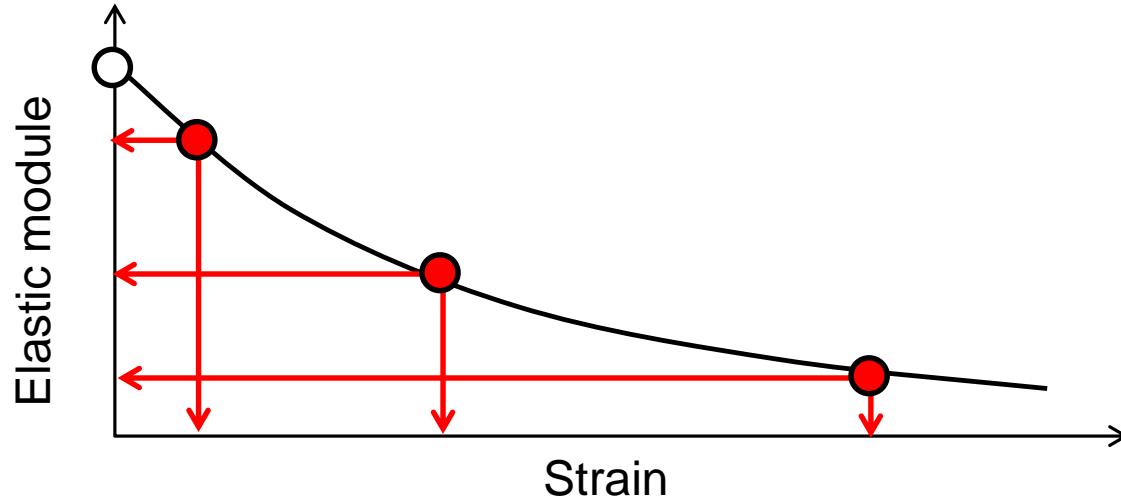

after

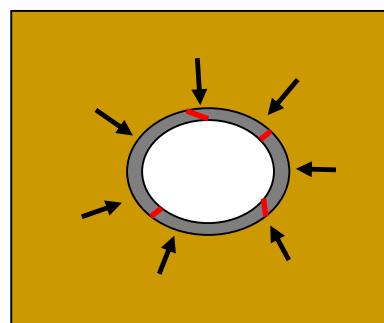

2. SETTING SWELLING MODEL

Model concept

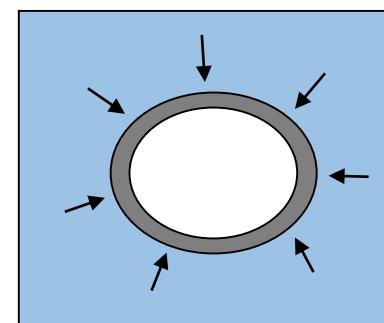

Set “elastic module” according to “strain”

No tunnel support

Tunnel support
with scratch

Tunnel support

2. SETTING SWELLING MODEL

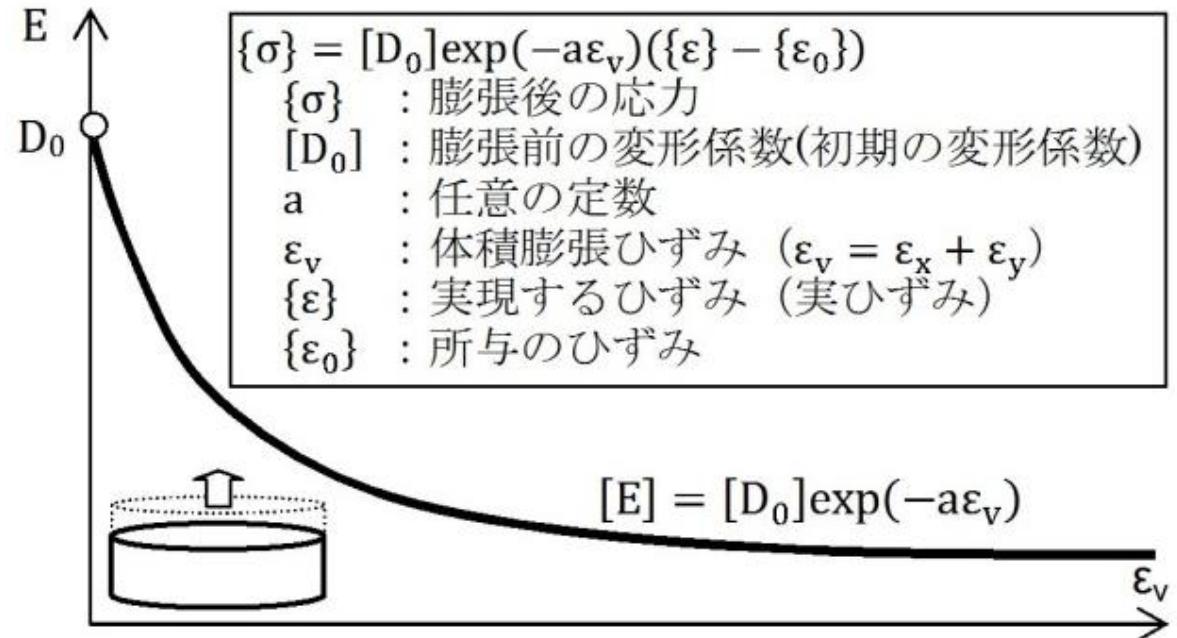

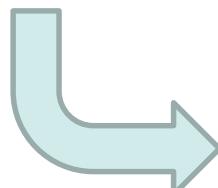

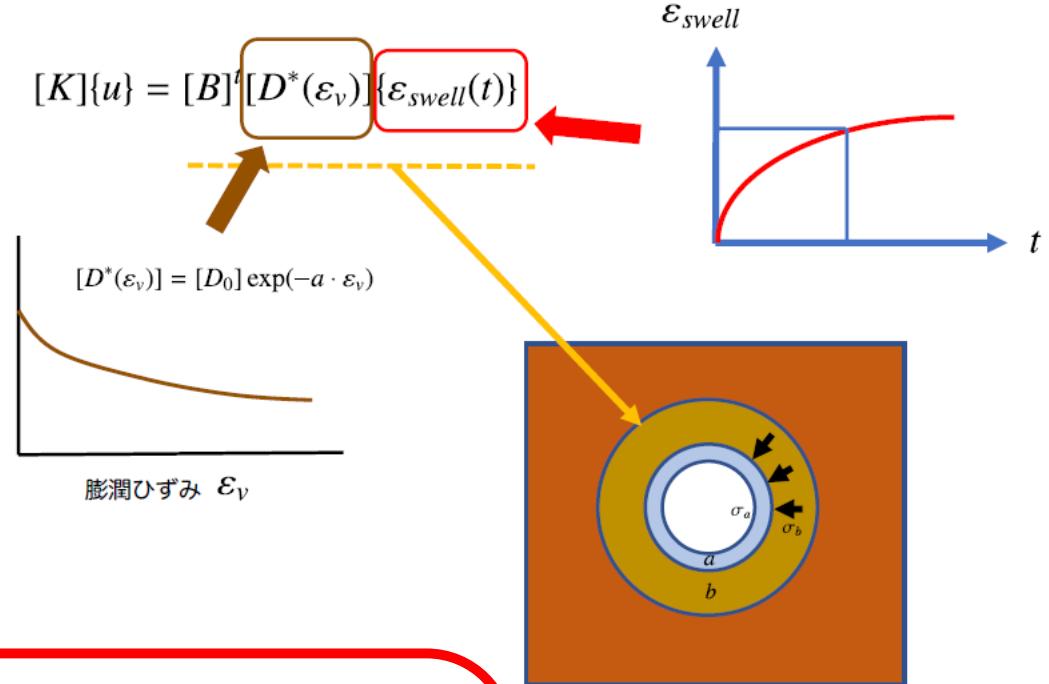

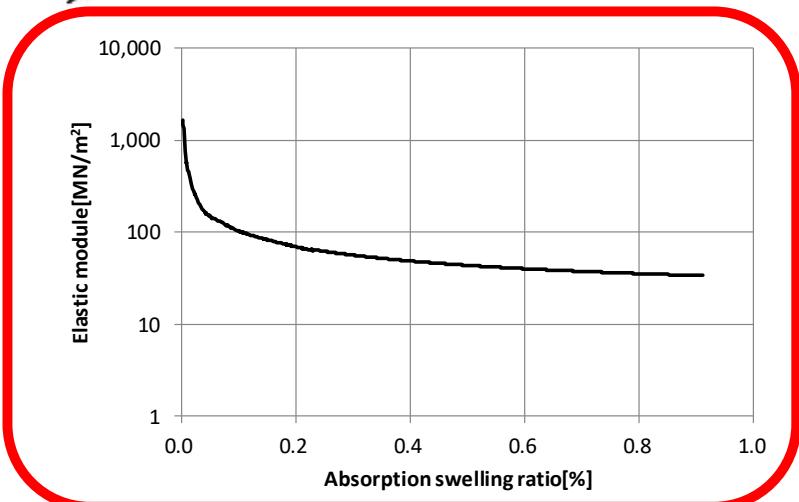

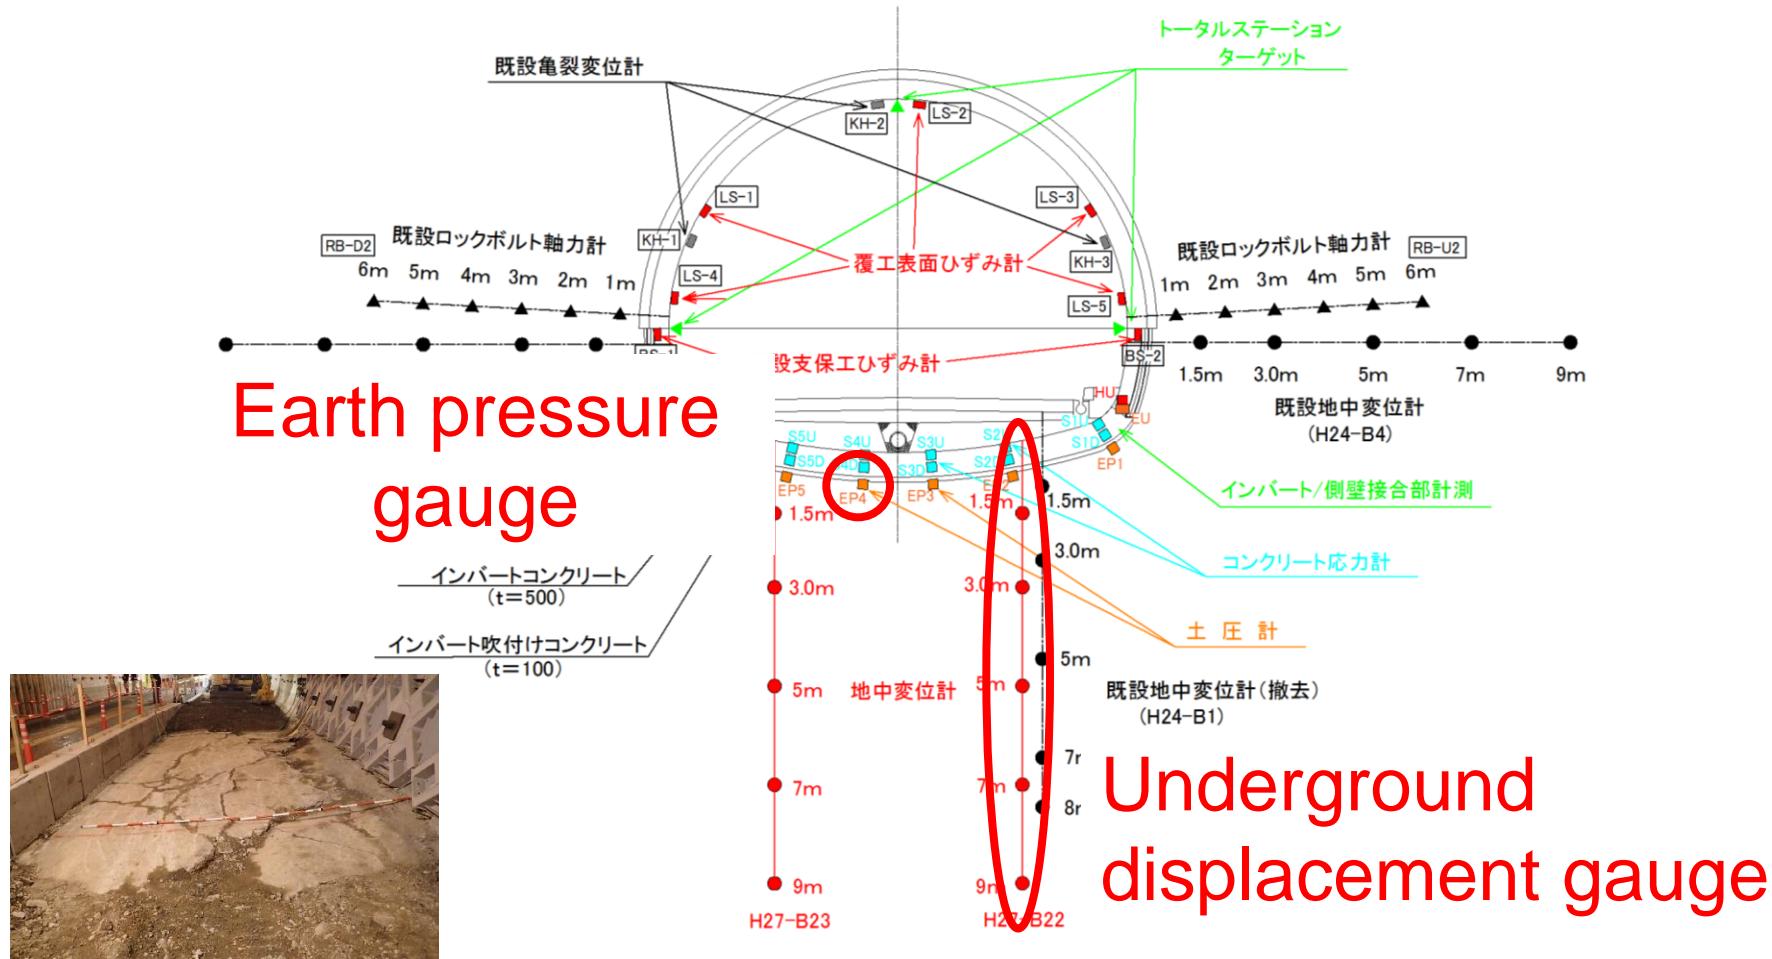

Figure 2. Relationship between the volumetric swelling strain and the elastic module

make these relationships from test results

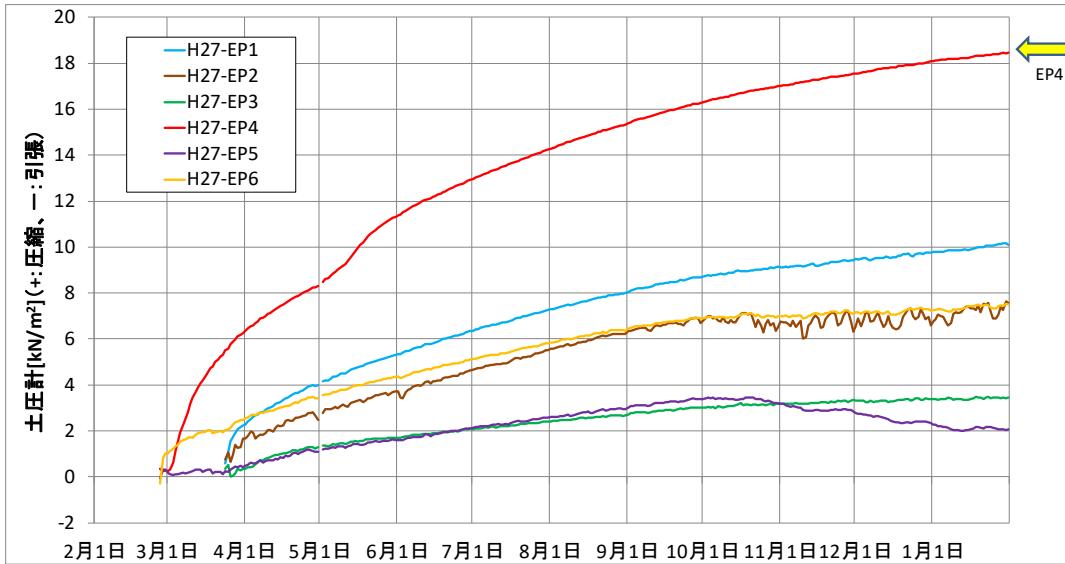

3. PARAMETRIC ANALYSIS

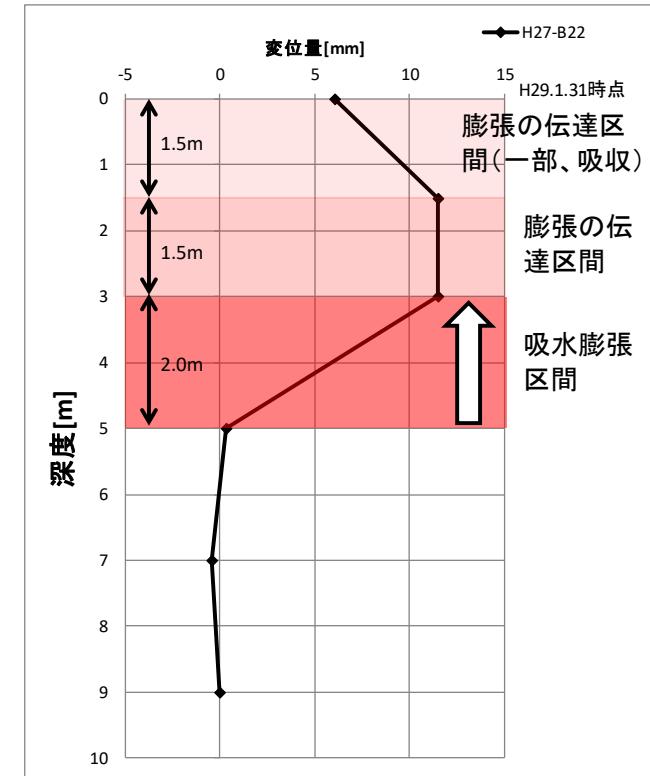

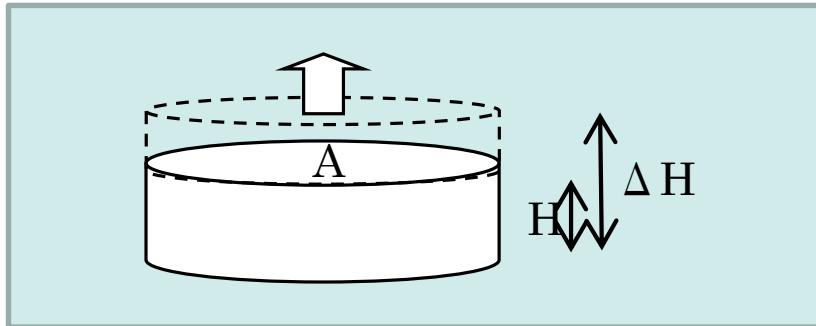

Instruments placed on the measuring cross section

3. PARAMETRIC ANALYSIS

Earth pressure gauge

Underground
displacement gauge

3. PARAMETRIC ANALYSIS

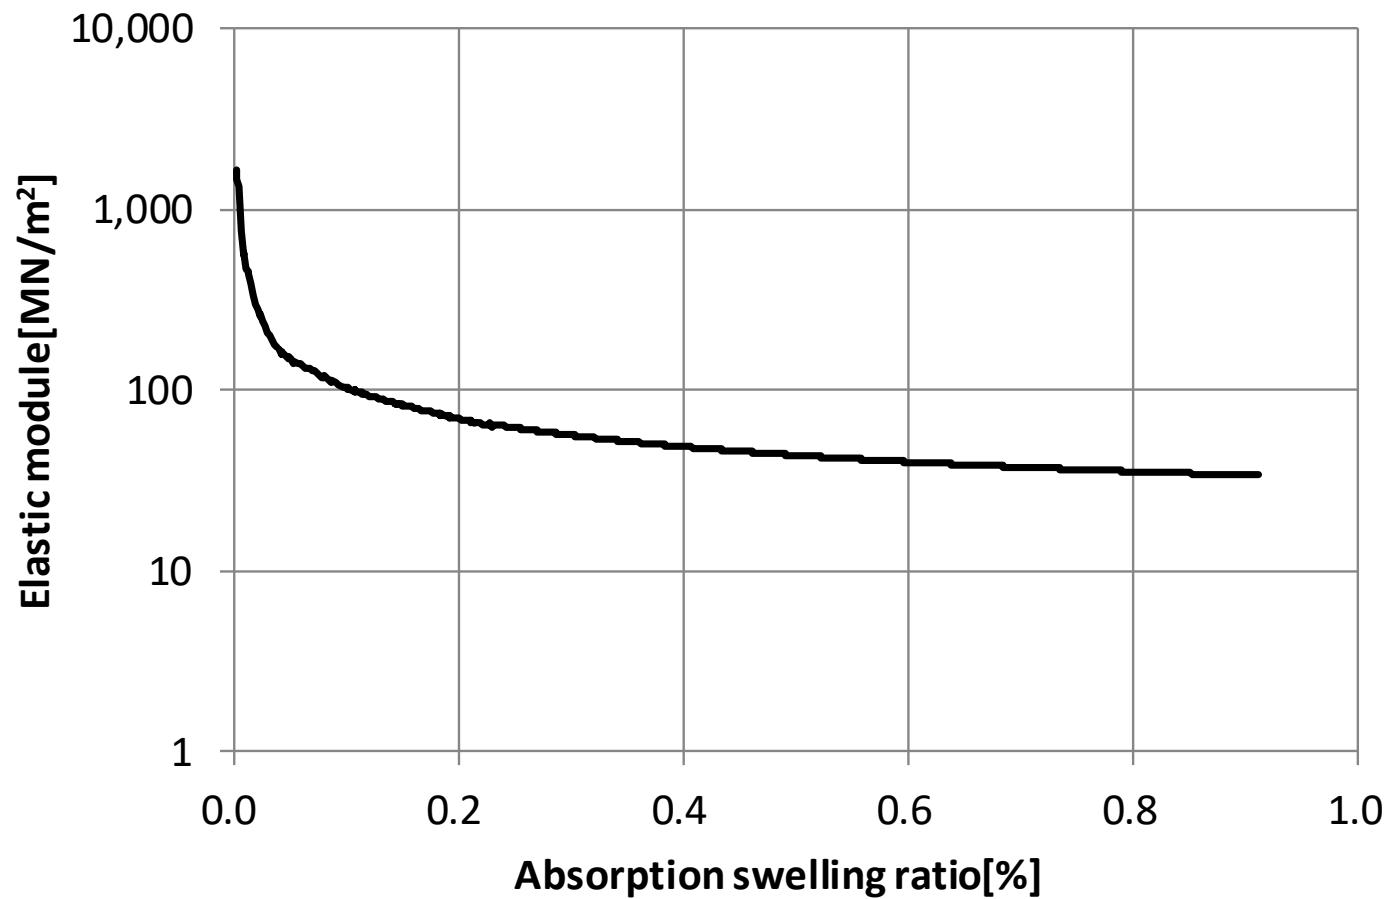

Figure 7 Relationship between the absorption swelling ratio and the elastic module

3. PARAMETRIC ANALYSIS

【 case1 】

the swelling area
was set around
the tunnel

Max displacement:
35mm

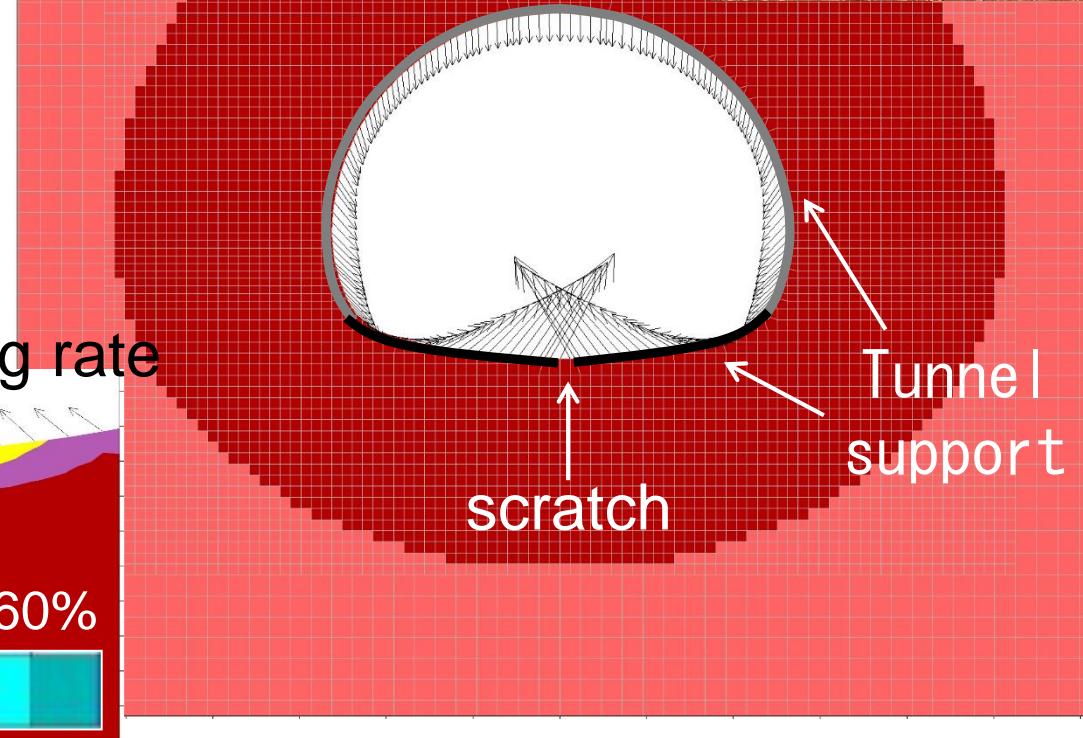

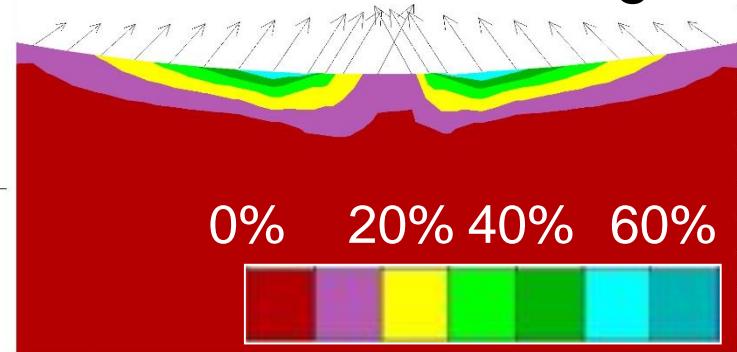

3. PARAMETRIC ANALYSIS

【 case3 】

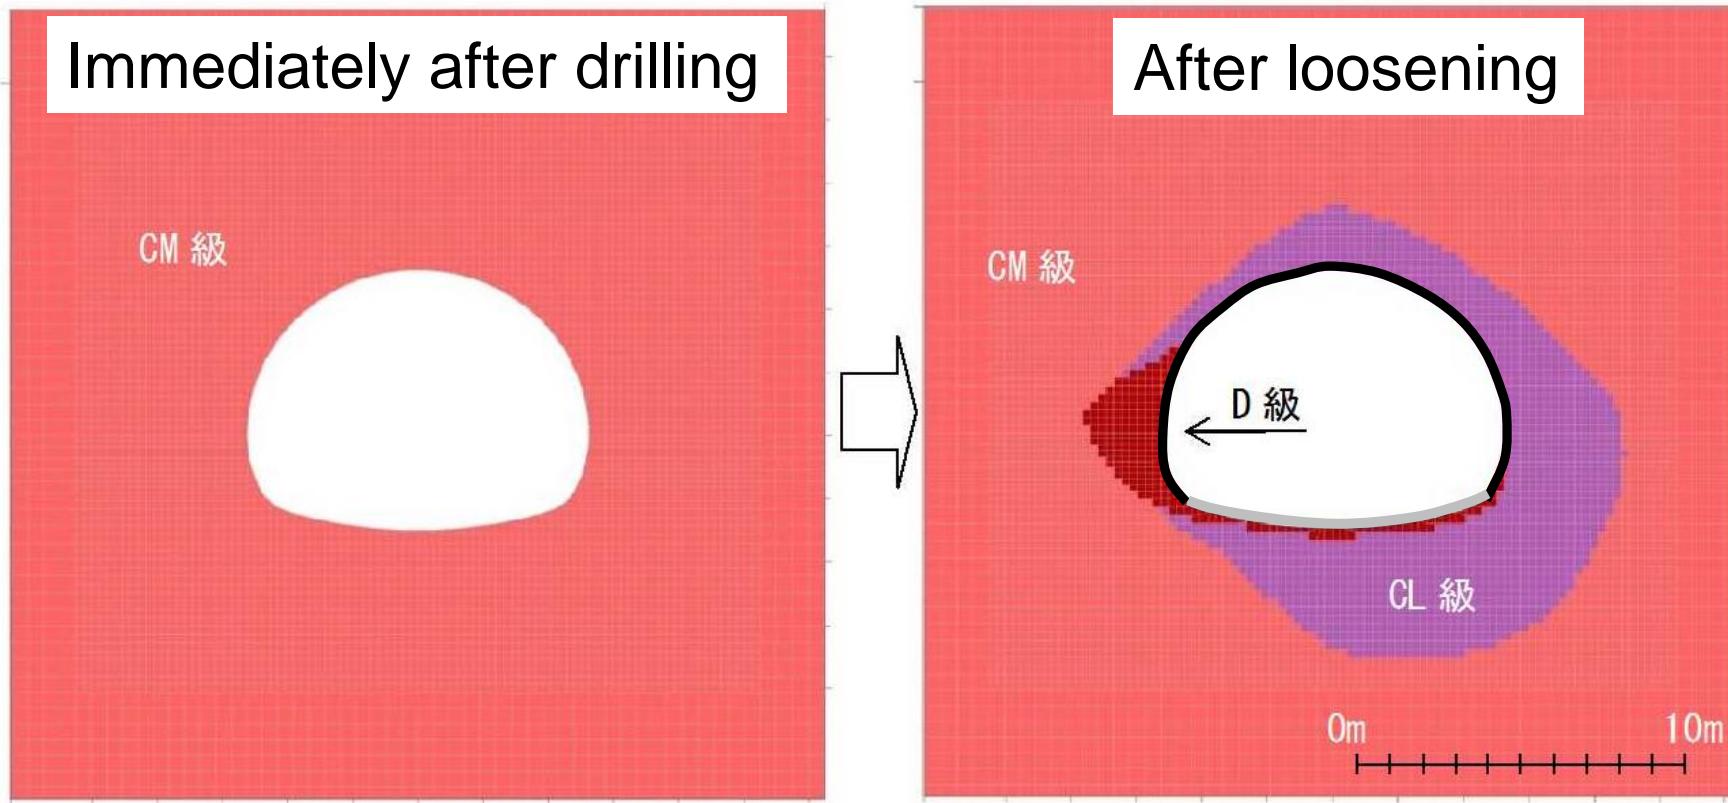

the swelling area
was set around
the tunnel

Max displacement:
125mm

Distribution of swelling rate

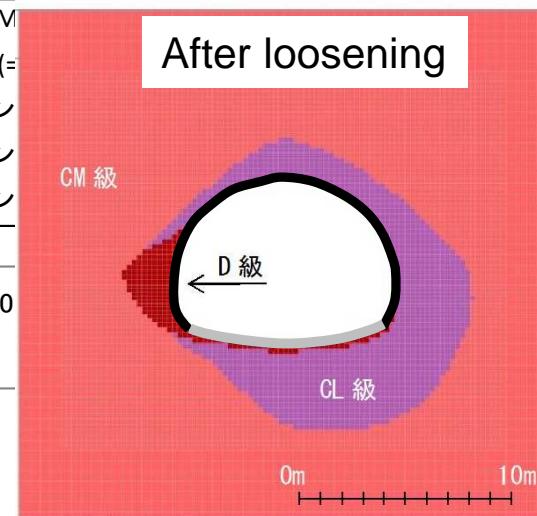

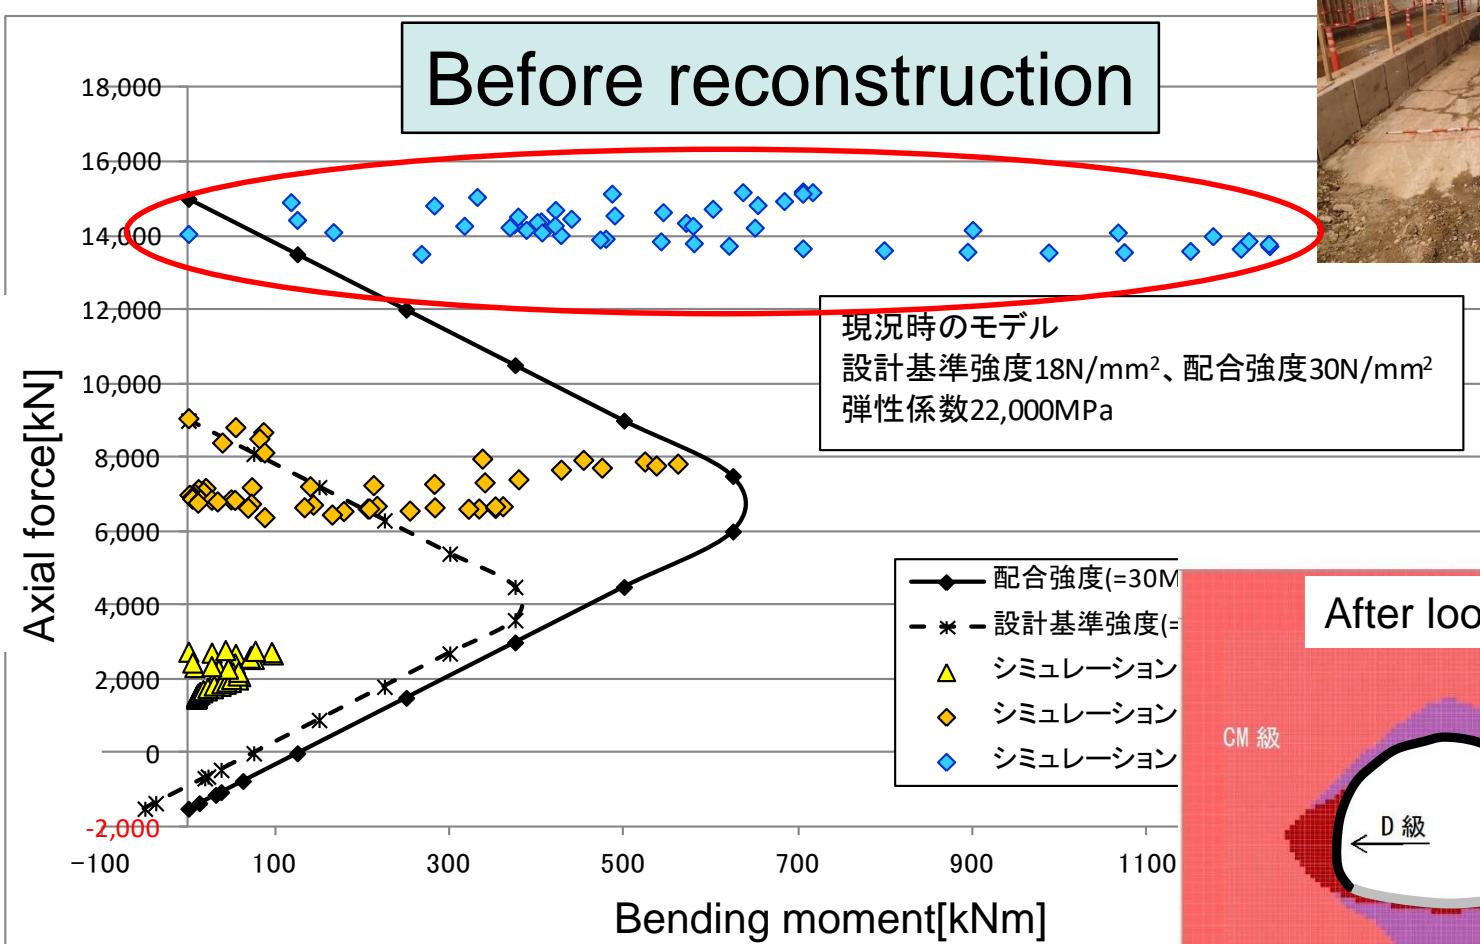

4. APPLICATION TO REPAIR DESIGN

Simulation model

4. APPLICATION TO REPAIR DESIGN

The distribution of the section force and the reconstruction tunnel specification

4. APPLICATION TO REPAIR DESIGN

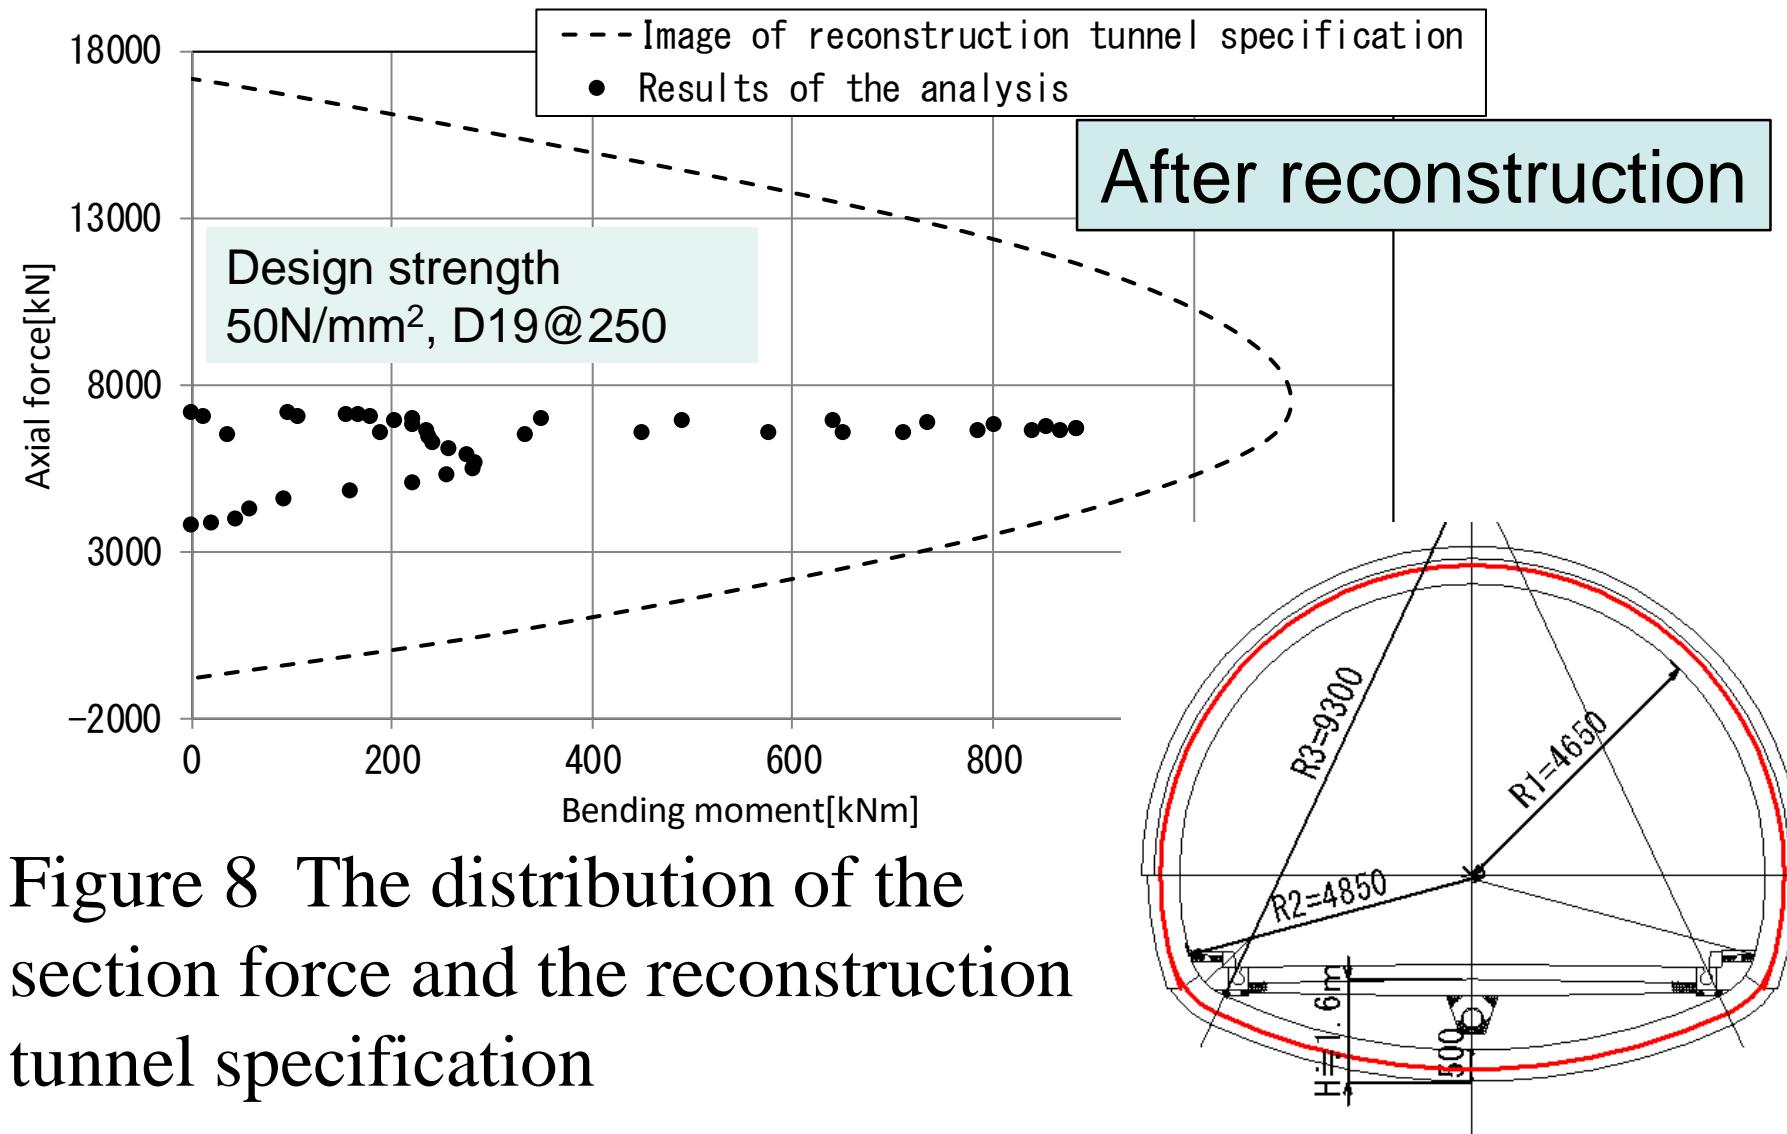

Figure 8 The distribution of the section force and the reconstruction tunnel specification

5. Conclusion

- We developed a numerical simulation model, which considered the interaction between the swelling pressure of the rock and the tunnel structure using the rock deformation due to swelling characteristic of the rock.
- By applying the model to the actual tunnel and examining the characteristics of the model, this model was consistent with the general mechanism that the swelling pressure.
- In addition, we examined the reconstruction design of the mountain tunnel under service. As a result, we decided on the repair design that included the distribution of section force obtained by analysis.
